

## Final report on investments in Grinda harbor

Grinda harbor is an important and well visited guest harbor in the middle part of the Stockholm archipelago. The island is a nature reserve owned by the Stockholm Archipelago Foundation. Grinda Wårdshus (inn) is a popular place to visit. The small grocery store is also a draw. In the harbor, guests have facilities such as a small restaurant, showers, WC, and a pump out station. The capacity of the sewage system needed to be increased to handle all the wastewater from the service building and the restaurant in a sustainable way.

The process of procuring the new system took a lot more time than anticipated. The procurement was done three times before we got an offer that would fit into the budget. Of course, the construction plans had to be altered and simplified to get an acceptable offer.

The only company who gave an offer in the third procurement was Score, which was awarded the contract. The work started in January 2020.

### The final construction plan

See attachment 1

### Picture from the construction work

### Result

The work was finished in the end of February. Grinda harbor now has a secure and sustainable way of handling the wastewater from the service building and the restaurant. The capacity of the wastewater treatment system can also handle a future increase of guests to the facilities.
